

2)

Concurrency is the simultaneous execution of one or more transactions in a database system.

Need for concurrent Execution
it improves throughput
better resource utilisation
reduced waiting time
It supports multiple users.

• Lost Update Problem

occurs when two transactions update same data item

• Dirty read problem

occurs when transaction reads data written by another transaction which is not committed yet.

eg: T_1 updates balance from 1000 to 800 which is not committed

T_2 reads balance as 800

T_1 rolls back
